

## **Development of electromagnetic flowmeter and calorimeter**

### **Annotation**

The objective of project is experimental development of set of expansion (module and solutions) to electromagnetic flowmeter and experimental development of BTU energy meter (calorimeter). In the project will be solved two separated devices, based on similar physical approaches, using identical development infrastructure. These devices will be developed by internal workers.

### **Objective**

Intended purpose of this project is based on requirements of customers on international markets. The main objective is improvement of competitiveness and sales potential of the company core products.

The second objective is the development of new products.

### **Result**

The result of project will be modules, new solutions and development of the device, which be able to measure supplied energy into and within a system.
